Fact Sheet: Swimmer's Itch

What is Swimmer’s Itch?
Swimmer’s itch is caused by an allergic reaction to parasites found in some birds and mammals. The parasites are released into fresh and salt water from infected snails. Rather than finding a host bird or animal, the parasite burrows into the skin of a human causing an allergic reaction and rash. People can be exposed to the parasites when working, wading or swimming in lakes and streams.

How is it treated?
If you find yourself itching after swimming:
- Get out and towel-off briskly; this helps to remove the tiny larvae that cause the itch.
- Shower as soon as possible after a swim.
- Try not to scratch because this may cause the rash to become infected.
- If itching becomes prolonged, see your doctor for additional treatment.

Treatments that may help relieve the itch:
- Apply an anti-itch cream or an over-the-counter corticosteroid cream.
- Apply a baking soda paste (mix baking soda and water) to the rash.
- Soak in an oatmeal bath.
- Apply a cool compress.

What are the symptoms?
- Tingling, burning or itching of the skin.
- Small red spots on the skin which begin to itch within 12 hours of exposure.
- Severity of the rash can vary from person to person.
- Itching may last up to a week or more.
- Symptoms are caused by an allergic reaction, so the more often you swim or wade in contaminated water, the more severe the symptoms get.

How is it spread?
- Swimmer’s itch is spread by direct contact with water that is contaminated with the parasites.
- It cannot be spread from person to person.

How is it prevented?
- Avoid still, fresh water during the mid-summer and fall months, especially on warm days.
- Avoid swimming in water which has a high number of ducks, geese, shore birds or snails.

Do not feed ducks and geese. Feeding ducks and geese bring them close to shore where they can spread the disease.
