

# Fact Sheet: Anthrax

## What is Anthrax?

Anthrax is a disease caused by spore-forming bacteria called *Bacillus anthracis*. Anthrax occurs in warm-blooded animals, including humans. The serious forms of human anthrax are inhalation anthrax, cutaneous anthrax, and intestinal anthrax.

## What are the symptoms?

Symptoms vary depending on how the disease was contracted. Symptoms usually occur within seven days of exposure.

### Inhalation anthrax:

- May resemble a cold (cough, fatigue, fever)
- May progress to respiratory distress and shock after a few days
- If untreated, usually results in death within 3-5 days after acute symptoms begin

### Intestinal anthrax:

- Nausea
- Loss of appetite
- Bloody diarrhea
- Fever

Followed by:

- Severe abdominal pain
- Vomiting of blood
- Severe diarrhea
- If untreated, usually results in death within 2-5 days after acute symptoms begin

### Cutaneous anthrax:

- Itchy bump that looks like an insect bite
- Blister-like lesion that eventually forms an ulcer with a black center in 2-6 days after initial symptoms begin. The lesions are not painful.

## How is it spread?

Anthrax is **NOT** spread from person to person. People get inhalation anthrax by inhaling spores in the air. Intestinal anthrax is spread by eating undercooked or raw meat products or dairy products of infected animals. Cutaneous anthrax is spread by direct skin contact with contaminated animals, animal products, or other contaminated objects.

## How is the disease treated?

Early treatment with antibiotics is necessary to prevent severe illness and death. When a case of anthrax is identified and reported, health authorities quickly conduct an investigation, determine the time and place of exposure and identify those individuals who need treatment with antibiotics. The Centers for Disease Control and Prevention (CDC) has stockpiled the antibiotics needed to treat large numbers of people. These supplies can be transported within hours.

## How is it prevented?

Anthrax vaccine is available for people in high-risk occupations and is not available to the general public. Anthrax vaccine is not recommended for children under the age of 18.
